

# Biology Introduces the Study of Life

Biology is a scientific study of plants and animals. The sophomores learn to identify living things according to phylums and classes. The structure and functions of most living things is taught all the way from the simplest algae to the most complex of all living things--man. Mr. Beresford enlivens things and keeps student interest with an occasional joke and some indoctrination on the merits of cross country over other sports.

Horticulture is perhaps Mr. Beresford's special class due to the fact that he is our chief research man in the area of horticulture at this station. Because of this, there are many interesting projects for students to see and study and to identify and learn about.

Among the many specimens of sea life, the starfish provides for interesting study. However, it does seem to appear that the class is more interested in being in pictures right now.
