

# Science

With general science as a basis, we are somewhat introduced to the organic and inorganic fields in chemistry. It is in this manner that students gain the opportunity to understand the chemical as well as physical changes that are brought about in our daily laboratory experiments, through the use of combinations of chemicals.

However, in order to understand, both the students and the teacher has to exert a great deal of time and energy.

With the great stress that is placed upon a general knowledge of science in today's changing world, it is paramount that that all students should at least learn some of the basic ideas as they are presented in the study of general science.
