

Biology

Biology, as a scientific study of plants and animals, gives us rather general but fascinating and informative data on the world of matter.

The structure and functions of most living things is instructed on a graduating type of scale from the most simple algae to the most complex of all--MAN.

Mr. Lysaker is the instructor of the biology sections of our physical sciences and is striving quite diligently with his pupils to impress upon them the importance of gaining further insight about the complex growth and development of life.

MR. HERSCHEL LYSAKER, Crookston, Minnesota; Concordia College, B.A.; Athletic Director, Director of Physical Education, Home Project Supervisor.

Horticulture

Horticulture is the study of plants, their growth, development and their many uses. This subject is an interesting one, not just because human life depends upon plant life, but also because the instructor, Mr. Beresford, enlivens the mood of his class with the merits of Cross Country over other sports and other provocative topics.

MR. B. C. BERESFORD, Crookston, Minnesota; B. S., Iowa State University of Illinois; Horticulture, Cross Country Coach.
